

1. AI-Based Digital Marketing Plan for Zomato

Question:

Pick any one of your favorite apps, such as Zomato, Instagram, or Flipkart, and outline a basic digital marketing plan using an AI-based marketing planning framework. Include the target audience, main marketing channels, and one AI-powered tool you would use for campaign optimization.

Answer:

I have selected **Zomato** for the digital marketing plan.

Marketing Element	Plan
Brand/App	Zomato
Target Audience	College students, working professionals, families, and regular online food-ordering customers
Marketing Objective	Increase app downloads, food orders, customer retention, and engagement
Main Marketing Channels	Instagram, YouTube, Google Ads, email marketing, push notifications, influencer marketing, and the Zomato app
Content Strategy	Short videos, food recommendations, restaurant highlights, offers, memes, user-generated content, and festival-specific campaigns
AI-Powered Tool	Google Analytics 4 with AI/insight features
AI Application	Analyze customer behavior, identify high-performing campaigns, predict trends, and optimize audience targeting
Key Performance Indicators (KPIs)	App downloads, click-through rate, conversion rate, orders, customer retention, and return on advertising spend

Basic AI Marketing Framework:

Analyze → Target → Personalize → Optimize → Measure

For example, AI can identify that a particular customer frequently orders dinner on weekends. Zomato can then send a personalized weekend offer at the most appropriate time to encourage another order.

2. AI-Generated Content Ideas for a Food Delivery App

Question:

Use ChatGPT or any AI tool to generate five unique content ideas for a new product launch campaign for a food delivery app like Swiggy.

Answer:

Suppose the new feature is called **“Smart Meal Planner”**, which uses AI to suggest meals based on the customer's preferences, budget, and previous orders.

No.	Campaign Idea	Description
1	“What Should I Eat Today?”	Create Instagram Reels where AI suggests meals for different moods such as “exam stress,” “movie night,” or “lazy Sunday.”
2	“AI Picks My Meal” Challenge	Ask college students to let the app's AI choose their meal and share the result on social media using a campaign hashtag.
3	“₹200 Food Challenge”	Show how the AI can create a satisfying meal within a fixed budget, such as ₹200.
4	“Your Food Personality”	Users answer a few fun questions and receive an AI-generated food personality along with personalized meal recommendations.
5	“7 Days, 7 Meals”	Launch a seven-day social-media campaign where the AI recommends a different meal every day based on the user's preferences.

Expected Benefit:

These campaigns can create **social-media engagement, user-generated content, awareness of the new feature, and app trials**, especially among college students and young consumers.

3. Customer Journey Map for Booking a Movie Ticket on BookMyShow

Question:

Create a simple customer journey map for a user booking a movie ticket on BookMyShow, and highlight at least two touchpoints where AI-based marketing interventions, such as personalized offers or chatbots, can be used.

Answer:

Customer Journey Map

Stage	Customer Action	Customer Need/Feeling	AI-Based Marketing Intervention
1. Awareness	Sees a movie advertisement or social-media post	Becomes interested in a movie	AI can show personalized movie advertisements based on the user's interests
2. Search/Discovery	Opens BookMyShow and searches for a movie	Wants to find a suitable movie and showtime	AI can recommend movies based on previous searches and bookings
3. Evaluation	Checks movie ratings, timings, theatres and ticket prices	Compares available options	AI can recommend the best showtime or theatre based on previous preferences
4. Ticket Selection	Selects seats and proceeds to payment	Wants a smooth booking experience	AI chatbot can answer questions about tickets, cancellation, payment, or seating

5. Payment	Completes the payment	Wants confirmation and security	AI can personalize payment offers or recommend relevant discounts
6. Post-Booking	Receives ticket confirmation and attends the movie	May be interested in another movie	AI can send personalized recommendations for similar movies

Two Important AI Touchpoints:

- **Personalized movie recommendations:** AI can analyze previous bookings and searches to recommend movies that the customer is more likely to watch.
- **Personalized offers/chatbot:** AI can provide relevant discounts and use a chatbot to quickly answer customer questions during the booking process.

Example: If a user regularly books action movies on Friday evenings, AI could recommend a new action movie with a Friday showtime and provide a personalized offer.

4. AI-Driven Analytics for a Music Streaming App

Question:

Imagine you are working for a music streaming app like Spotify. List three ways you could use AI-driven analytics to improve user engagement through digital marketing campaigns.

Answer:

No.	AI-Driven Analytics Method	How It Improves Engagement
1	Personalized Recommendations	AI analyzes listening history, favorite artists, genres and skips to create personalized playlists and recommend new songs.
2	Optimal Notification Timing	AI identifies when individual users are most likely to open the app and sends music recommendations or campaign notifications at those times.

3 Churn Prediction

AI identifies users whose listening activity is declining and targets them with personalized playlists, new-release alerts or special offers to encourage them to return.

Example:

If AI detects that a user has recently stopped listening to music as frequently, the marketing team could send a personalized campaign such as “**We Miss Your Music! Here Are 10 New Songs You Might Love.**”

Overall Conclusion:

AI-driven analytics helps music-streaming platforms move from **general marketing to personalized marketing**. By understanding user preferences, predicting behavior and delivering the right message at the right time, a streaming app can increase **engagement, retention, listening time and customer loyalty**.
